Volcono Plot

```
plot( res$log2FoldChange, -log(res$padj) )

Q. Improve this plot by completing the below code, which adds color and axis labels

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color blue those with adjusted p-value less than 0.01 and absolute fold change more than
inds <- (p.adjust(0.01)) & (abs(res$log2FoldChange) > 2 )

Gene Set Gene Ontology (GO) Enrichment is a method to determine over-represented or under-represented GO terms for a given set of genes. GO terms are formal structured controlled vocabularies (ontologies) for gene products in terms of their biological function. The goal of this analysis is to determine the biological process the given set of genes are associated with.

To perform Gene Set GO Enrichment online go to the website http://www.geneontology.org/page/go-enrichment-analysis. Paste your significant gene list from section 4. Then, select "biological process" and "homo sapiens", and click submit.

> Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The pathways that are the most significant include: Rho GTPases, Miro GTPases,and RHOBTB3.
